

Tesla Installers

Posted on Sep 26, Posted by [Athena Electrical](#) Category [General Electrics](#)

We are sure you've heard the hype about the fantastic range of Tesla Electric cars. But did you know that Tesla has now developed a home storage unit incorporating their state of the art battery technology.

The Tesla Powerwall stores energy generated by solar panels during the day to power your home during the evenings.

Recently introduced to the UK, Athena Electrical is proud to be one of just a few authorized Tesla Installers.

If you are fed up with the prices charged by the energy suppliers and would like to gain energy independence, consider combining solar panels with lithium-ion batteries to maximize self-sufficiency and save money on electricity bills.

The sleek and stylish looking Tesla battery can be wall mounted internally or externally and has capacity to store up to 6.4kWh of electrical energy - more than enough to power most household's night-time consumption. Once the battery has been emptied, your system will automatically switch to using energy from the Grid.

Cost to supply and install 6.4kWh retrofit Tesla Battery System - from £4,300 exc VAT

Cost to supply and install Electric Vehicle Charging Point – from £750.00 exc VAT
